

ABSTRACT OF THE DISCLOSURE

To provide an inkjet recording method which not only prevents bleeding, but also drastically improves the color development of ink, while avoiding

5 deterioration of fixing properties, overcomes the problem of strike-through of coloring ink on a recording medium, and is capable of high-speed printing.

The recording method in which recording on a  
10 recording medium is performed by applying on the recording medium a reaction liquid containing a polyvalent metal salt and then applying thereon a pigment ink having a lower surface tension than that of the above reaction liquid, the method comprising  
15 the steps of bringing the reaction liquid into contact with the pigment ink on the top surface of the recording medium, and forming a filmy agglomerate composed of collective aggregates at the interface between the reaction liquid and the pigment ink in  
20 contact with each other.
